

## Chapter 8

# Selecting a Qualified Doctor

**SUCCESSFUL, SAFE EYE CARE PROCEDURES** require a skilled, experienced eye doctor. Your doctor should be an experienced fitter of gas permeable lenses and skilled at the interpretation of corneal topography. These are basic and necessary skills in the practice of GM. Your doctor must also be aware of the latest innovations in Gentle Molding. These new innovations in Gentle Molding point up the need for your doctor to stay up with continuing education and new technology.

Ask yourself whether the doctor you select strives for perfection and seeks the best results. As with any procedure, a patient's best chance of success rests with a specialist who devotes a good part of his practice to what he does best. Look for a doctor whose practice primarily focuses on Gentle Molding. If he does a good deal of Gentle Molding, he is likely devoting his time to research and improving his skill in this exciting field of better vision through the medical science of corneal molding.
